OUTLINE

We follow chapters 1-5, 7 in Galí's excellent book:

- Introduction
- Monetary Policy in Classical Model
- The Basic New Keynesian Model
- Monetary Policy Design in the Basic New Keynesian Model
- S Time-Consistency in Monetary Policy: Discretion vs. Commitment
- Monetary Policy in Open Economy

Note: many of the slides are reproduced from Galí's book's slide collection

MOTIVATION

- Monetary policy has been a central area of macroeconomic research
- The macroeconomics of monetary policy studies the interaction between monetary policy, inflation and business cycles (fluctuations in economic activity)
- The modern models of monetary policy build on as most of the recent macroeconomic research on real business cycle models by Kydland and Prescott (1982) and Prescott (1986).

REAL BUSINESS CYCLE REVOLUTION

METHODOLOGICAL REVOLUTION

Intertemporally optimizing agents. Budget and technology constraints.

CONCEPTUAL REVOLUTION

- In a frictionless markets under perfect competition business cycles are efficient: no need for stabilization; stabilization may be counter-productive.
- Economic fluctuations are caused by technology shocks: they are the main source of fluctuation.
- Monetary factors (price level) has a limited (or no) role: money (price level) has no effect on the real economy, real wages, relative prices, consumption, investments, employment,

-INTRODUCTION

LNEW KEYNESIAN MODEL

NEW KEYNESIAN MODEL

- Methodologically similar to RBC models.
- Builds on the following features:
 - monopolistic competition
 - nominal rigidities
 - $\rightarrow\,$ short-run non-neutrality of money: real interest rate affect money supply.
- Leads to differences w.r.t RBC models: economy's response to shocks is generally inefficient.
- Removing the effects of non-neutrality is potentially welfare improving
 → role for monetary policy.

-INTRODUCTION

LNEW KEYNESIAN MODEL

EMPIRICAL EVIDENCE

SUPPORTIVE TO PRICE RIGIDITY

4–6 quarters by Bils and Klenow (2004), 8–11 quarters by Nakamura and Steinsson (2008), 8-11 by Dhyne et al. (2006). Wages are also rigid: 1 year, downward rigidity by Dickens et al. (2007)

NON-NEUTRALITY HARD TO MEASURE

The expected inflation does not move as nominal interest rates, when latter is changed, the real interest rate changes and, as a result, equilibrium output and employment.

This is hard to show empirically. Christiano et al. (2005) provides example.

3 THE BASIC NEW KEYNESIAN MODEL

MONETARY POLICY IN CLASSICAL MODEL

L HOUSEHOLDS

HOUSEHOLD PROBLEM

Households

- Decide how much they consume, C_t , in each period and
- how much they work, N_t .
- They know the current and historical values of nominal wages W_t,
- and their savings in bonds B_t , with bond price Q_t , and
- their lump-sum taxes, T_t .
- Price level is P_t .

They cannot accumulate infinite debt (transversality condition):

$$\lim_{T\to\infty}E_tB_T\geq 0$$

◆□ > ◆問 > ◆臣 > ◆臣 > ─ 臣

MONETARY POLICY IN CLASSICAL MODEL

L_{HOUSEHOLDS}

Households maximize the expected present value of utility

$$\max_{\{C_t, N_t\}} \mathsf{E}_0 \sum_{t=0}^{\infty} U(C_t, N_t)$$

subject to the following (flow) budget constraint

$$P_t C_t + Q_t B_t \le B_{t-1} + W_t N_t - T_t.$$

MONETARY POLICY IN CLASSICAL MODEL

SIDESTEP: LOG-LINEARIZATION

SIDESTEP TO LOG-LINEARIZATIONS

TAYLOR APPROXIMATIONS ARE ACCURATE ONLY IN THE NEIGHBORHOOD OF A POINT

As a consequence (loosely speaking) an economic model has to be stationary. This means that very often we need to stationarize the model first, ie to express it in terms of stationary variables.

Suppose we have

$$f(X_t, Y_t) = g(Z_t), \qquad (3.4)$$

with strictly positive X, Y, Z (ie the linearization point). The steady state counterpart is f(X, Y) = g(Z).

This simple summarization is, for example, in the slides by Jürg Adamek). (http://www.vwl.unibe.ch/studies/3076_e/linearisation_slides.pdf)

MONETARY POLICY IN CLASSICAL MODEL

SIDESTEP: LOG-LINEARIZATION

Let's denote $x_t = \log(X_t)$ (for any variable). Start from replacing $X_t = \exp(\log(X_t))$ in (3.4),

$$f\left(e^{\log(X_t)}, e^{\log(Y_t)}\right) = g\left(e^{\log(Z_t)}\right)$$
 ,

Taking first-order Taylor approximations from both sides:

$$f(X, Y) + f'_{1}(X, Y)X(x_{t} - x) + f'_{2}(X, Y)Y(y_{t} - y)$$

= $g(Z) + g'(Z)Z(z_{t} - z)$ (3.5)

Often we denote $\hat{x}_t \equiv x_t - x$.

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● ○ ○ ○ ○

MONETARY POLICY IN CLASSICAL MODEL

SIDESTEP: LOG-LINEARIZATION

LOG-LINEARIZATION OF (3.3) AROUND NON-ZERO INFLATION AND GROWTH

In a growing economy $C_{t+1} > C_t$ and in a non-zero-inflation economy $P_{t+1} > P_t$. Hence, neither *C* nor *P* is a point. The growth rates are, however, stationary. Let's denote $\dot{X}_t \equiv X_t/X_{t-1}$. Then (3.3) is

$$Q_t = eta \, \mathsf{E}_t \left(\dot{C}_{t+1}^{-\sigma} \dot{P}_{t+1}^{-1}
ight)$$

In the steady state: $Q = \beta \dot{C}^{-\sigma} / \dot{P}$. Denote $\rho \equiv -\log \beta$, then $\rho = -q - (\sigma \Delta c + \pi)$, where $\pi_t \equiv \dot{P}_t$ and $\Delta x_t \equiv \dot{x}_t$. Note also that $i_t = -q_t$.

ANTTI RIPATTI (BOF)

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ▶ ◆ ○ ◆

MONETARY POLICY IN CLASSICAL MODEL

SIDESTEP: LOG-LINEARIZATION

Apply mechanically (3.5)

$$Q + Q(q_t - q) = \underbrace{\beta \dot{C}^{-\sigma} / \dot{P}}_{=Q} - \sigma \underbrace{\beta \frac{\dot{C}^{-\sigma}}{\dot{P}}}_{=Q} \frac{1}{\dot{C}} \dot{C} (\mathsf{E}_t \Delta c_{t+1} - \Delta c) + (-1) \underbrace{\beta \frac{\dot{C}^{-\sigma}}{\dot{P}}}_{=Q} \frac{1}{\dot{P}} \dot{P} (\mathsf{E}_t \pi_{t+1} - \pi).$$

and divide by Q and get rid of constants to obtain

$$q_t - q = -\sigma(\mathsf{E}_t \,\Delta c_{t+1} - \Delta c) - (\mathsf{E}_t \,\pi_{t+1} - \pi)$$

and combine with log of steady-state to obtain

$$i_t - \mathsf{E}_t \,\pi_{t+1} - \rho = \sigma \,\mathsf{E}_t \,\Delta c_{t+1} \tag{3.6}$$

MONETARY POLICY IN CLASSICAL MODEL

L_{FIRMS}

FIRMS

Firms use only labour N to produce output Y:

$$Y_t = A_t N_t^{1-\alpha}. \tag{3.9}$$

Log-linearized as $y_t = a_t + (1 - \alpha)n_t$. A_t is exogenously given stationary process (a shock). Firms maximize profits

 $P_t Y_t - W_t N_t$

subject to production function (3.9) and obtain the following FOC:

$$(1-\alpha)A_t N_t^{-\alpha} = \frac{W_t}{P_t}.$$
(3.10)

which gives labour demand schedule and tells us how much labour the firm is willing to hire for given real wages and technological process A_t , = -23

MONETARY POLICY, INFLATION AND THE BU

MONETARY POLICY, INFLATION AND THE BUSINESS CYCLE MONETARY POLICY IN CLASSICAL MODEL

L_{EQUILIBRIUM}

Equilibrium

Goods market clearing

$$y_t = c_t$$
 (11)

Labor market clearing

$$\sigma c_t + \varphi n_t = a_t - \alpha n_t + \log(1 - \alpha)$$

Asset market clearing:

$$y_t = E_t \{ y_{t+1} \} - \frac{1}{\sigma} (i_t - E_t \{ \pi_{t+1} \} - \rho)$$

Aggregate production relationship:

$$y_t = a_t + (1 - \alpha) \ n_t$$

MONETARY POLICY IN CLASSICAL MODEL

L_{EQUILIBRIUM}

A CLOSER LOOK AT EMPLOYMENT RESPONSE

Let's rewrite (3.2) as follows

$$N_t^{\varphi} = \frac{W_t}{P_t} C_t^{-\sigma}$$

The elasticity of substitution is unity (or $1/\varphi$), and wealth elasticity is $-\sigma$ (or $-\sigma/\varphi$).

- \bullet The substitution effect dominates the negative wealth effect if $\sigma < 1$ and
- vice versa if $\sigma > 1$.
- They cancel each other when $\sigma = 1$ (logarithmic utility).

イロト イヨト イヨト イヨト 二日

MONETARY POLICY IN CLASSICAL MODEL

EQUILIBRIUM

TECHNOLOGY PROCESS DEFINES PROPERTIES OF REAL INTEREST RATE

 r_t will go down if $E_t a_{t+1} < a_t$ and go up if $E_t a_{t+1} > a_t$ (like in the growing economy).

SUMMARY OF EQUILIBRIUM

In equilibrium, output, consumption, employment, real wages and real rate of return are function of productivity shock only — not of anything else! Hence monetary factors play no role in real economy, ie monetary policy is neutral w.r.t. real variables.

MONETARY POLICY IN CLASSICAL MODEL

MONETARY POLICY RULES

FIXED INTEREST RATE RULE

Consider standard Fisher equation that we have derived above

$$i_t = \mathsf{E}_t \, \pi_{t+1} + r_t = \mathsf{E}_t \, p_{t+1} - p_t + r_t. \tag{3.12}$$

Its solution should be of the form

$$p_t = -\mathsf{E}_t \sum_{i=0}^{\infty} (i_{t+i} - r_{t+i}).$$

It is easy to see that this does not converge in general.

San

イロト イポト イヨト イヨト 一日

MONETARY POLICY IN CLASSICAL MODEL

MONETARY POLICY RULES

SIMPLE INFLATION BASED INTEREST RATE RULE

Consider an interest rate rule

$$i_t = \rho + \phi_\pi \pi_t$$

and combine it with the Fisher equation to obtain

$$\rho + \phi_{\pi} \pi_t = \mathsf{E}_t \, \pi_{t+1} + \mathsf{r}_t.$$

Its solution is of the form

$$\pi_t = \mathsf{E}_t \sum_{i=0}^{\infty} \left(\frac{1}{\phi_{\pi}}\right)^i (r_{t+i} - \rho),$$

which is convergent if 0 \leq 1/ ϕ_{π} < 1, ie

TAYLOR PRINCIPLE $\phi_{\pi} > 1$ ANTTI RIPATTI (BOF) MONETARY POLICY, INFLATION AND THE BU 14 Mar 2010 24 / 100

MONETARY POLICY IN CLASSICAL MODEL

MONETARY POLICY RULES

MONEY GROWTH RULE

Substitute (3.12) into the money demand equation to obtain

$$m_t - p_t = y_t - \eta(\mathsf{E}_t \, \pi_{t+1} + r_t).$$

Solve price level forward

$$p_{t} = \frac{1}{1+\eta} E_{t} \sum_{i=0}^{\infty} \frac{\eta}{1+\eta} (m_{t+i} + \eta r_{t+i} - y_{t+i})$$

= $m_{t} + E_{t} \sum_{i=1}^{\infty} \frac{\eta}{1+\eta} \Delta m_{t+i} + E_{t} \sum_{i=0}^{\infty} \frac{\eta}{1+\eta} (\eta r_{t+i} - y_{t+i})$

and the implied nominal interest rate

200

イロト イヨト イヨト 一日

MONETARY POLICY IN CLASSICAL MODEL

└─MONETARY POLICY RULES

$$i_t = \eta^{-1} [y_t - (m_t - p_t)] = \eta^{-1} \sum_{k=1}^{\infty} \left(\frac{\eta}{1+\eta}\right)^k E_t \{\Delta m_{t+k}\} + v_t$$

where $v_t \equiv \eta^{-1}(u_t + y_t)$ is independent of policy.

MONETARY POLICY IN CLASSICAL MODEL

MONETARY POLICY RULES

- Real variables are independent of monetary policy.
- Monetary policy has an important impact on nominal variables. •
- No monetary policy rule is better that any other.
- The non-existence of the interaction between nominal and real variables is in contrast to empirical evidence.

イロト イポト イヨト イヨト

MONETARY POLICY IN CLASSICAL MODEL

MOTIVATION OF MONEY

VARIOUS APPROACHES TO MOTIVATE MONEY

In the above classical models, money had a role of unit of account: *cashless economy, cashless limit.*

Money provides liquidity services. They can be modelled, for example, as

- Real balances generate utility: Money-in-the-utility-function (MIUF)
- The transaction cost approach
 - Explicit microfounded matching models starting from double coincidence of wants
 - Cash-in-advance (CIA) constraint

We study MIUF and leave CIA as an exercise. First item can be found from micro courses.

MONETARY POLICY IN CLASSICAL MODEL

MOTIVATION OF MONEY: MIUF

Optimality Conditions

$$\begin{aligned} &-\frac{U_{n,t}}{U_{c,t}} = \frac{W_t}{P_t}\\ Q_t &= \beta \ E_t \left\{ \frac{U_{c,t+1}}{U_{c,t}} \frac{P_t}{P_{t+1}} \right\}\\ &\frac{U_{m,t}}{U_{c,t}} = 1 - \exp\{-i_t\} \end{aligned}$$

where marginal utilities evaluated at $\left(C_t, \frac{M_t}{P_t}, N_t\right)$

Two cases:

- utility separable in real balances \implies neutrality
- utility non-separable in real balances (e.g. $U_{cm} > 0$) \implies non-neutrality

◆□ > ◆□ > ◆三 > ◆三 > ・三 = ・ つへぐ

MONETARY POLICY IN CLASSICAL MODEL

└─ MOTIVATION OF MONEY: MIUF

How Important is the implied non-neutrality? (Walsh, ch. 2)

Utility specification:

$$U\left(C_t, \frac{M_t}{P_t}, N_t\right) = \frac{X(C_t, M_t/P_t)^{1-\sigma}}{1-\sigma} - \frac{N_t^{1+\varphi}}{1+\varphi}$$

where

$$\begin{split} X(C_t, M_t/P_t) \; &\equiv \; \left[(1 - \vartheta) \; C_t^{1-\nu} + \vartheta \; \left(\frac{M_t}{P_t} \right)^{1-\nu} \right]^{\frac{1}{1-\nu}} \quad for \; \nu \neq 1 \\ &\equiv \; C_t^{1-\vartheta} \; \left(\frac{M_t}{P_t} \right)^\vartheta \quad for \; \nu = 1 \end{split}$$

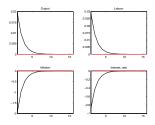

Policy Rule: $\Delta m_t = \rho_m \Delta m_{t-1} + \varepsilon_t^m$ Calibration: $\nu = 2.56$; $\sigma = 2 \implies U_{cm} > 0$ Effects of Exogenous Monetary Policy Shock (Fig 2.3 and 2.4)

MONETARY POLICY IN CLASSICAL MODEL

└─ OPTIMAL POLICY

OPTIMAL MONETARY POLICY IN A CLASSICAL SETTING

Assume a hypothetical social planner that maximize the utility of representative household, that contains real money.

Social planner faces a static problem, since only an individual household (not the society as a whole) can smooth its consumption over time. The planner's problem is to maximize

$$\max U(C_t, \frac{M_t}{C_t}, N_t)$$

subject to resource constraint

$$C_t = A_t N_t^{1-\alpha}$$

San

イロト イポト イヨト イヨト 一日

MONETARY POLICY IN CLASSICAL MODEL

OPTIMAL POLICY

The optimality conditions are given by

$$-\frac{U_{n,t}}{U_{c,t}} = (1 - \alpha)A_t N_t^{-\alpha}$$
(3.13)

$$U_{m,t} = 0$$
 (3.14)

- (3.13) First corresponds the labour market equilibrium that is independent of monetary policy (except in the non-separable MIUF case)
- (3.14) Second condition equates marginal utility of real balances to the "social"marginal cost of producing them (zero!).

From household's problem we know

$$\frac{U_{m,t}}{U_{c,t}}=1-e^{-i_t}.$$

RHS can be zero only if $i_t = 0$. This is called Friedman rule. (In steady-state) this results $\pi = -\rho(\equiv -\log(\beta)) < 0$, ie in the steady state, the price level declines at the rate of time preference.

MONETARY POLICY IN CLASSICAL MODEL

CPTIMAL POLICY

Implementation

$$i_t = \phi \ (r_{t-1} + \pi_t)$$

for some $\phi > 1$. Combined with the definition of the real rate:

$$E_t\{i_{t+1}\} = \phi \ i_t$$

whose only stationary solution is $i_t = 0$ for all t. Implied equilibrium inflation:

$$\pi_t = -r_{t-1}$$

THE BASIC NEW KEYNESIAN MODEL

L_{PRELIMINARIES}

CES AGGREGATOR

In modern macro models with imperfect competition, the Dixit-Stiglitz, or Constant-Elasticity-of-Substitution aggregator plays an important role. Consider a static optimization problem of a firm that buy infinite number of intermediate products C(i), puts them together using technology

$$C = \left[\int_0^1 C(i)^{\frac{\epsilon-1}{\epsilon}} di\right]^{\frac{\epsilon}{1-\epsilon}},$$
(4.1)

where ϵ is the elasticity of substitution (and also the price elasticity of the demand function). Its optimization problem is

$$\max_{C(i)} C \cdot P - \int_0^1 C(i)P(i)di$$

subject to the production technology (4.1).

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへぐ

THE BASIC NEW KEYNESIAN MODEL

PRELIMINARIES

The optimality conditions are given by

$$C(i) = \left[\frac{P(i)}{P}\right]^{-\epsilon} C \quad \forall i \in [0, 1].$$

This is also the demand function of a good C(i). (You must work out the details by yourself.) Plug this to the profits and use zero profit constraint to get the aggregate price level (=price index=marginal costs):

$$P = \left[\int_0^1 P(i)^{1-\epsilon} di\right]^{\frac{1}{1-\epsilon}}.$$
(4.2)

THE BASIC NEW KEYNESIAN MODEL

LINTRODUCTION

INTRODUCTION

The basic new Keynesian model consists of two key ingredients:

IMPERFECT COMPETITION

We assume that there is a continuum of firms and each produce a differentiated intermediate good for which it sets the price.

PRICE RIGIDITIES

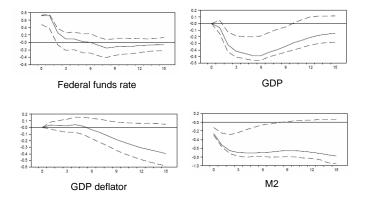

We assume (a la Calvo (1983)) that, in each period, only a fraction of firms can change their price.

MONETARY POLICY, INFLATION AND THE BUSINESS CYCLE THE BASIC NEW KEYNESIAN MODEL

L HOUSEHOLDS

HOUSEHOLDS

Household problem is the same as in the case of classical model except that the aggregate consumption consists of continuum of goods:

$$C_t = \left[\int_0^1 C_t(i)^{\frac{e-1}{e}} di\right]^{\frac{e}{1-e}}$$

Household must allocate its consumption to different goods according to their relative price

$$C_t(i) = \left[\frac{P_t(i)}{P_t}\right]^{-\epsilon} C_t, \qquad (4.3)$$

where the aggregate price index is as in (4.2).

イロト イボト イモト 一日

L_{HOUSEHOLDS}

The optimality condition are as before and assuming same functional form of utility function, and loglinearizing, we obtain

$$w_t - p_t = \sigma c_t + \varphi n_t \tag{4.4}$$

$$c_t = \mathsf{E}_t \, c_{t+1} - \frac{1}{\sigma} (i_t - \mathsf{E}_t \, \pi_{t+1} - \rho) \tag{4.5}$$

$$m_t - p_t = y_t - \eta i_t. \tag{4.6}$$

MONETARY POLICY, INFLATION AND THE BUSINESS CYCLE
THE BASIC NEW KEYNESIAN MODEL
FIRMS

FIRMS

Assume continuum of identical firms indexed by $i \in [0, 1]$ that use the following common production technology

$$Y_t(i) = A_t N_t(i)^{1-\alpha}.$$

All firms face an identical demand curve (4.3) and take aggregate price index P_t and aggregate consumption index C_t as given.

THE BASIC NEW KEYNESIAN MODEL

└─_{FIRMS}

CALVO FAIRY

- A firm may change price of its product only when Calvo Fairy visits.
- The probability of a visit is 1θ .
- It is independent of the length of the time and the time elapsed since the last adjustment. Hence, in each period the 1θ share of firms may change their price and rest, θ , keep their price unchanged.
- Mathematically, Calvo Fairy's visits follows Bernoulli process (discrete version of Poisson process).
- The probability distribution of the number of periods between the visits of Calvo Fairy is geometric distribution.
- The expected value of geometric distribution and, hence, the average number of periods between the price changes (of a firm) is

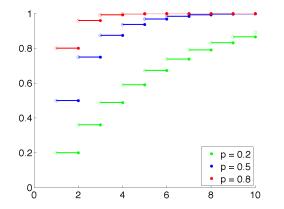

$$\frac{1}{1- heta}.$$

FIRMS

OPTIMAL PRICE SETTING

Let P_t^* denote the price level of the firm that receives price change signal. This is the price level of the firm that Calvo Fairy visits.

When making its pricing decision, the firm takes into account that it can change is price with the probability $1 - \theta$, ie the chosen price remains the same with probability θ .

$$\max_{P_t^{\star}} E_t \sum_{k=0}^{\infty} \theta^k Q_{t,t+k} \left\{ P_t^{\star} Y_{t+k}(P_t^{\star}) - \Psi_{t+k} \left[Y_{t+k}(P_t^{\star}) \right] \right\},$$

where $\Psi_{t+k}[Y_{t+k}(P_t^*)]$ is firm's total costs that depends on the demand function $Y_{t+k}(P_t^*)$ with a relative price of P_t^*/P_{t+k} .

◆□▶ ◆□▶ ◆三▶ ◆三▶ ・三 ・ つへつ

THE BASIC NEW KEYNESIAN MODEL

└─_{FIRMS}

and

$$Y_{t+k}(P_t^{\star}) = \left(\frac{P_t^{\star}}{P_{t+k}}\right)^{-\epsilon} C_{t+k}$$

The first one is the demand function that the firm faces and is due to the households' consumption index.

$$Q_{t,t+k} \equiv \beta^k \left(\frac{C_{t+k}}{C_t}\right)^{-\sigma} \left(\frac{P_t}{P_{t+k}}\right).$$

The second equation is the nominal *stochastic discount factor* (pricing kernel), that household use to price any financial asset. Note, that in our standard household's optimisation problem, the household price one-period bond using the very same pricing kernel.

イロト イヨト イヨト イヨト 三日

L THE BASIC NEW KEYNESIAN MODEL

L_{FIRMS}

Equivalently,

$$\sum_{k=0}^{\infty} \theta^k \ E_t \left\{ Q_{t,t+k} \ Y_{t+k|t} \ \left(\frac{P_t^*}{P_{t-1}} - \mathcal{M} \ MC_{t+k|t} \ \Pi_{t-1,t+k} \right) \right\} = 0$$

where $MC_{t+k|t} \equiv \psi_{t+k|t}/P_{t+k}$ and $\Pi_{t-1,t+k} \equiv P_{t+k}/P_{t-1}$

Perfect Foresight, Zero Inflation Steady State:

$$\frac{P_t^*}{P_{t-1}} = 1 \quad ; \quad \Pi_{t-1,t+k} = 1 \quad ; \quad Y_{t+k|t} = Y \quad ; \quad Q_{t,t+k} = \beta^k \quad ; \quad MC = \frac{1}{\mathcal{M}}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ ▲ □▶ ▲ □ ▶ ▲ □ ▶

L THE BASIC NEW KEYNESIAN MODEL

L_{FIRMS}

Log-linearization around zero inflation steady state:

$$p_t^* - p_{t-1} = (1 - \beta\theta) \sum_{k=0}^{\infty} (\beta\theta)^k E_t \{ \widehat{mc}_{t+k|t} + p_{t+k} - p_{t-1} \}$$

where $\widehat{mc}_{t+k|t} \equiv mc_{t+k|t} - mc$.

Equivalently,

$$p_t^* = \mu + (1 - \beta \theta) \sum_{k=0}^{\infty} (\beta \theta)^k E_t \{ mc_{t+k|t} + p_{t+k} \}$$

where $\mu \equiv \log \frac{\epsilon}{\epsilon - 1}$. Flexible prices $(\theta = 0)$:

$$p_t^* = \mu + mc_t + p_t$$

 $\implies mc_t = -\mu$ (symmetric equilibrium)

THE BASIC NEW KEYNESIAN MODEL

FIRMS

AGGREGATE PRICE LEVEL

Note that all those firms that may set their price level (ie where Calvo Fairy visits) will choose identical price P_t^* . Let $S(t) \subset [0, 1]$ represent the set of firms that do not reoptimize their price in period t. Note that "the distribution of prices among firms not adjusting in period t corresponds to the distribution effective prices in period t - 1, though with total mass reduced to θ ". Remember the aggregate price index P_t in eq (4.2). The aggregate price level has to follow this functional form

$$P_{t} = \left[\int_{\mathcal{S}(t)} P_{t}(i)^{1-\epsilon} di + (1-\theta) (P_{t}^{\star})^{1-\epsilon} \right]^{\frac{1}{1-\epsilon}}$$
$$= \left[\theta P_{t-1}^{1-\epsilon} + (1-\theta) (P_{t}^{\star})^{1-\epsilon} \right]^{\frac{1}{1-\epsilon}}. \quad (4.7)$$

San

・ロト ・回ト ・ヨト ・ヨト - ヨ

FIRMS

LOG-LINEARIZATION OF AGGREGATE PRICE LEVEL

Stationarize equation (4.7), ie express it in inflation rates and in relative prices: Divide (4.7) by P_{t-1} and rise it power $1 - \epsilon$:

$$\Pi_t^{1-\epsilon} = \theta + (1-\theta) \left(\frac{P_t^{\star}}{P_{t-1}}\right)^{1-\epsilon}$$

where $\Pi_t = P_t/P_{t-1}$. Log-linearizing it around $\Pi = 1$ and $P_t^*/P_t = 1$ (zero steady state inflation, unit relative prices in steady-state):

$$\pi_t = (1-\theta)(p_t^{\star} - p_{t-1}).$$

The Efficient Allocation

$$\max U\left(C_{t}, N_{t}\right)$$
where $C_{t} \equiv \left[\int_{0}^{1} C_{t}(i)^{1-\frac{1}{\epsilon}} di\right]^{\frac{\epsilon}{\epsilon-1}}$ subject to:
 $C_{t}(i) = A_{t} N_{t}(i)^{1-\alpha}, \ all \ i \in [0, 1]$

$$N_{t} = \int_{0}^{1} N_{t}(i) \ di$$

Optimality conditions:

$$\begin{split} C_t(i) &= C_t, \ all \ i \in [0,1] \\ N_t(i) &= N_t, \ all \ i \in [0,1] \\ - \frac{U_{n,t}}{U_{c,t}} &= MPN_t \end{split}$$

where $MPN_t \equiv (1 - \alpha) A_t N_t^{-\alpha}$.

▲□▶ ▲□▶ ▲目▶ ▲目▶ 三日 - のへで

Sources of Suboptimality of Equilibrium

- 1. Distortions unrelated to nominal rigidities:
 - Monopolistic competition: $P_t = \mathcal{M} \frac{W_t}{MPN_t}$, where $\mathcal{M} \equiv \frac{\varepsilon}{\varepsilon 1} > 1$

$$\implies \quad -\frac{U_{n,t}}{U_{c,t}} = \frac{W_t}{P_t} = \frac{MPN_t}{\mathcal{M}} < MPN_t$$

Solution: employment subsidy τ . Under flexible prices, $P_t = \mathcal{M} \frac{(1-\tau)W_t}{MPN_t}$.

$$\implies -\frac{U_{n,t}}{U_{c,t}} = \frac{W_t}{P_t} = \frac{MPN_t}{\mathcal{M}(1-\tau)}$$

Optimal subsidy: $\mathcal{M}(1-\tau) = 1$ or, equivalently, $\tau = \frac{1}{\varepsilon}$.

• *Transactions friction* (economy with valued money): assumed to be negligible

◆□▶ ◆□▶ ◆三▶ ◆三▶ ・三 ・ つへつ

2. Distortions associated with the presence of nominal rigidities:

• Markup variations resulting from sticky prices: $\mathcal{M}_t = \frac{P_t}{(1-\tau)(W_t/MPN_t)} = \frac{P_t\mathcal{M}}{W_t/MPN_t}$ (assuming optimal subsidy)

$$\implies -\frac{U_{n,t}}{U_{c,t}} = \frac{W_t}{P_t} = MPN_t \frac{\mathcal{M}}{\mathcal{M}_t} \neq MPN_t$$

Optimality requires that the average markup be stabilized at its frictionless level.

• Relative price distortions resulting from staggered price setting: $C_t(i) \neq C_t(j)$ if $P_t(i) \neq P_t(j)$. Optimal policy requires that prices and quantities (and hence marginal costs) are equalized across goods. Accordingly, markups should be identical across firms/goods at all times.

◆□ > ◆□ > ◆三 > ◆三 > ・三 = ・ つへぐ

Optimal Monetary Policy in the Basic NK Model

Assumptions:

 \bullet optimal employment subsidy

 \Longrightarrow flexible price equilibrium allocation is efficient

 \bullet no inherited relative price distortions, i.e. $P_{-1}(i)=P_{-1}$ for all $i\in[0,1]$

 \implies the efficient allocation can be attained by a policy that stabilizes marginal costs at a level consistent with firms' desired markup, *given existing prices*:

- no firm has an incentive to adjust its price, i.e. $P_t^* = P_{t-1}$ and, hence, $P_t = P_{t-1}$ for $t = 0, 1, 2, \dots$ As a result the aggregate price level is fully stabilized and no relative price distortions emerge.
- equilibrium output and employment match their counterparts in the (undistorted) flexible price equilibrium allocation.

Shortcomings of Optimal Rules

- they assume observability of the natural rate of interest (in real time).
- this requires, in turn, knowledge of:
 - (i) the true model
 - (ii) true parameter values
 - (iii) realized shocks

Alternative: "simple rules" , i.e. rules that meet the following criteria:

- the policy instrument depends on observable variables only,
- do not require knowledge of the true parameter values
- ideally, they approximate optimal rule across different models

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへぐ

Simple Monetary Policy Rules

Welfare-based evaluation:

$$\mathbb{W} \equiv -E_0 \sum_{t=0}^{\infty} \beta^t \left(\frac{U_t - U_t^n}{U_c C} \right) = \frac{1}{2\lambda} E_0 \sum_{t=0}^{\infty} \beta^t \left(\kappa \ \tilde{y}_t^2 + \epsilon \ \pi_t^2 \right)$$

 \Rightarrow expected average welfare loss per period:

$$\mathbb{L} = \frac{1}{2\lambda} \left[\kappa \ var(\widetilde{y}_t) + \epsilon \ var(\pi_t) \right]$$

See Appendix for Derivation.

◆□▶ ◆□▶ ◆三▶ ◆三▶ ● ○ ○ ○

A Taylor Rule

$$i_t = \rho + \phi_\pi \ \pi_t + \phi_y \ \widehat{y}_t$$

Equivalently:

$$i_t = \rho + \phi_\pi \ \pi_t + \phi_y \ \widetilde{y}_t + v_t$$

where $v_t \equiv \phi_y \ \hat{y}_t^n$

Equilibrium dynamics:

$$\begin{bmatrix} \widetilde{y}_t \\ \pi_t \end{bmatrix} = \mathbf{A}_T \begin{bmatrix} E_t \{ \widetilde{y}_{t+1} \} \\ E_t \{ \pi_{t+1} \} \end{bmatrix} + \mathbf{B}_T \left(\widehat{r}_t^n - \phi_y \ \widehat{y}_t^n \right)$$

where

$$\mathbf{A}_T \equiv \Omega \begin{bmatrix} \sigma & 1 - \beta \phi_{\pi} \\ \sigma \kappa & \kappa + \beta (\sigma + \phi_y) \end{bmatrix} ; \quad \mathbf{B}_T \equiv \Omega \begin{bmatrix} 1 \\ \kappa \end{bmatrix}$$

and $\Omega \equiv \frac{1}{\sigma + \phi_y + \kappa \phi_\pi}$. Note that $\hat{r}_t^n - \phi_y \ \hat{y}_t^n = -\psi_{ya}^n \left[\sigma(1 - \rho_a) + \phi_y\right] a_t$ Exercise: $\Delta a_t \sim AR(1)$ + modified Taylor rule $i_t = \rho + \phi_\pi \ \pi_t + \phi_y \ \Delta y_t$

DISCRETION VS COMMITMENT: MONETARY POLICY AND TIME-CONSISTENCY PROBLEM

LINTRODUCTION

DISCRETION VS COMMITMENT: TIME-CONSISTENCY OF OPTIMAL PLANS

COMMITMENT

Commitment is the ability to deliver on past promises no matter what the particular current situation is.

DISCRETION

Under discretion, a policymaker is allowed to change policy depending on current circumstances and to disregard any past promises.

TIME-CONSISTENCY

Economists refer to the desire to alter previously made plans as the time-consistency problem because, at each date, an individual or policymaker finds it tempting to deviate from what an earlier plan dictated.

ANTTI RIPATTI (BOF)

MONETARY POLICY, INFLATION AND THE BU

DISCRETION VS COMMITMENT: MONETARY POLICY AND TIME-CONSISTENCY PROBLEM

LINTRODUCTION

BACKGROUND

Time-consistency problem arises only if central bank faces a temptation to lower the output gap by rising inflation.

DIVINE COINCIDENCE: INHERENT FEATURE OF MANY New-Keynesian Models

Stabilizing inflation is equivalent to stabilizing the welfare-relevant output gap! This generalizes to models with wage frictions. \longrightarrow More profound *real frictions* are needed.

Is monetary policy too easy? Are there no trade-offs?

FLEXIBLE INFLATION TARGETING

Monetary policy makers claim that — at least in the short-run — there is trade-off between stabilizing inflation or ouput/employment. Hence, a central bank should avoid too much instability in output while committing to a medium term inflation target.

ANTTI RIPATTI (BOF)

MONETARY POLICY, INFLATION AND THE BU

DISCRETION VS COMMITMENT: MONETARY POLICY AND TIME-CONSISTENCY PROBLEM

LINTRODUCTION

THE MONETARY POLICY PROBLEM: THE CASE OF AN EFFICIENT STEADY STATE

- When nominal rigidities coexist with real imperfections, the flexible price equilibrium allocation is generally inefficient.
- When the possible inefficiencies associated with the flexible price equilibrium do not affect the steady state, which remains efficient.
- Here we analyze the optimal monetary policy problem under that assumption.
- Short run deviations between the natural and efficients levels of output.
- Cost-push, or markup shocks: assume gap between the two follows a shocks stationary process, with a zero mean, due to presence of some real imperfections that generate a time-varying gap between output and its efficient counterpart, even in the absence of price rigidities.

DISCRETION VS COMMITMENT: MONETARY POLICY AND TIME-CONSISTENCY PROBLEM

LINTRODUCTION

BREAKING DIVINE COINCIDENCE

Easy candidates

MARKUP SHOCK

Suppose that the elasticity of substitution contains exogenous variation, $\epsilon_t.$ Then the markup

$$\mu_t = \log\left(\frac{\epsilon_t}{\epsilon_t - 1}\right)$$

enters to New-Keynesian Phillips curve as follows

$$\pi_t = \mathsf{E}_t \, \pi_{t+1} + \lambda \, (\hat{mc}_t + \hat{\mu}_t)$$

Later, we denote $u_t \equiv \lambda \hat{\mu}_t$.

14 Mar 2010 59 / 100

イロト イボト イモト 一日

DISCRETION VS COMMITMENT: MONETARY POLICY AND TIME-CONSISTENCY PROBLEM

LINTRODUCTION

BREAKING DIVINE COINCIDENCE...

WAGE MARKUP SHOCK

Analoguous to product market markup. Creates wedge between the marginal rate of substitution and marginal product of labour.

Presence of markup shocks leads to

- Differences between natural and efficient level of output
- allows for short run deviations between the natural and efficient levels of output.
- assume that the gap between the two follows a stationary process, with zero mean:

$$u_t = \rho_u u_{t-1} + \varepsilon_t^u, \quad \varepsilon_t^u \sim \operatorname{iid}(0, \sigma_u^2).$$

 time variations in gap between efficient and natural levels of output reflected in markup generate a tradeoff for monetary policy, since make it impossible to attain simultaneously zero inflation and efficient ° ANTH RIPATH (BOF) MONETARY POLICY, INFLATION AND THE BU 14 MAR 2010 60 / 100

DISCRETION VS COMMITMENT: MONETARY POLICY AND TIME-CONSISTENCY PROBLEM

LINTRODUCTION

The Monetary Policy Problem

$$\min E_0 \{ \sum_{t=0}^{\infty} \beta^t \left[\alpha_y \ \widetilde{y}_t^2 + \pi_t^2 \right] \}$$
(1)

subject to:

$$\pi_t = \beta \ E_t\{\pi_{t+1}\} + \kappa \ \widetilde{y}_t + u_t$$

where $\{u_t\}$ evolves exogenously according to

 $u_t = \rho_u \ u_{t-1} + \varepsilon_t$

In addition:

$$\widetilde{y}_t = -\frac{1}{\sigma} (i_t - E_t \{ \pi_{t+1} \} - r_t^n) + E_t \{ \widetilde{y}_{t+1} \}$$
(2)

Note: utility based criterion requires $\alpha_y = \frac{\kappa}{\epsilon}$

DISCRETION VS COMMITMENT: MONETARY POLICY AND TIME-CONSISTENCY PROBLEM

└─ NO STEADY-STATE DEVIATIONS

DEGREE OF POLICY ACCOMMODATION

- Under discretion, the central bank finds it optimal to accommodate partly the inflationary pressures resulting from the cost-push shock, and thus let inflation increase.
- However, the increase in inflation is smaller than the one that would obtain if the output gap remained unchanged:

$$\pi_t = \frac{1}{1 - \beta \rho_u} u_t.$$

ANTTI RIPATTI (BOF)

DISCRETION VS COMMITMENT: MONETARY POLICY AND TIME-CONSISTENCY PROBLEM

└─ NO STEADY-STATE DEVIATIONS

Central bank is assumed to be able to commit, with full credibility, to a *policy plan*

In the case of our model, the plan consists of a specification of the desired levels of inflation and output gap at

- all possible dates, and
- states of nature,
- Ourrent and future.

DISCRETION VS COMMITMENT: MONETARY POLICY AND TIME-CONSISTENCY PROBLEM

└─ NO STEADY-STATE DEVIATIONS

COMPARING DISCRETION AND COMMITMENT

- Note, that the loss function is quadratic! Large deviations results relatively higher losses than small deviations.
- In both policies, both output gap and inflation return to zero. In discretionary policy this is reached immediately after the first period and in the case of commitment gradually.

COMMITMENT: WHY PERSISTENTLY NEGATIVE OUTPUT GAP AND INFLATION?

By committing to such a response, the central bank manages to improve the output gap/inflation tradeoff in the period when shock occur.

• A credible central bank is able tie his hands and smooth the losses over time. Discretionary central bank reoptimizes every period (that is known by the agents) and does not have this luxury.

ANTTI RIPATTI (BOF)

DISCRETION VS COMMITMENT: MONETARY POLICY AND TIME-CONSISTENCY PROBLEM

└─ NO STEADY-STATE DEVIATIONS

SUMMARY

Given the convexity of the loss function inflation and output gap deviations, the dampening of those dviations in the period of shock brings about an improvement in overall welfare relative to the case of discretion, because the implied benefits are not offset by the (relatively small) losses generated by the deviations in the subsequent periods (and which are absent in the discretionary case).

STABILIZATION BIAS

Discretionary policy attempts to stabilize output gap in the medium term more thatn the optimal policy under commitment calls for, without *internalizing* the benefits in terms of short term stability that results fro from allowing larger deviations of the output gap at future horizons.

DISCRETION VS COMMITMENT: MONETARY POLICY AND TIME-CONSISTENCY PROBLEM

DISTORTED STEADY-STATE: PERMANENT TRADE-OFF

DISTORTED STEADY-STATE

• Assume that there exist (unmodeled) real distortions/imperfections that generate permanent gap between the natural and the efficient levels of output, which is reflected in an inefficient steady-state

$$-\frac{U_n}{U_c} = MPN(1-\Phi)$$

- Example: A non-zero steady-state markup (that is NOT corrected by a subsidy).
- Losses are given by

$$\mathsf{E}_{0}\sum_{t=0}^{\infty}\beta^{t}\left[\frac{1}{2}\left(\pi_{t}^{2}+\alpha_{x}\hat{x}_{t}^{2}\right)-\Lambda\hat{x}_{t}\right]$$

, where \hat{x}_t is the deviation of a welfare relevant output gap from its (negative) steady-state.

14 Mar 2010 66 / 100

DISCRETION VS COMMITMENT: MONETARY POLICY AND TIME-CONSISTENCY PROBLEM

DISTORTED STEADY-STATE: PERMANENT TRADE-OFF

DISTORTED STEADY-STATE...

• New-Keynesian Phillips curve is as before, except that

$$u_t \equiv \kappa (\hat{y}_t^e - \hat{y}_t^n).$$

 Furthermore, the steady-state distortion has the same order magnitude as fluctuation in the output gap and inflation, ie "small". We need to be able analyze behavior in the neighborhood of the zero inflation steady-state.

DISCRETION VS COMMITMENT: MONETARY POLICY AND TIME-CONSISTENCY PROBLEM

DISTORTED STEADY-STATE: PERMANENT TRADE-OFF

SUMMARIZING

DISCRETION

The response to cost-push shock is not affected (ie previous impulse responses are valid). Stabilization bias remains. It has effect to the steady-state around which the economy fluctuates.

Inflation bias: Due to inefficiently low level of output, central bank has a desire to increase output by inflating economy. This is known by the agents, and it results positive inflation. (See the constant term in the optimality conditions.)

COMMITMENT

Having a committing "technology" (ability) central bank may (asymptotically) get rid of the *inflation bias*. This is a result of additional channel where price level converges to a constant (defined by the

OPEN ECONOMY AND MONETARY POLICY

LINTRODUCTION

Motivation

- The basic new Keynesian model for the closed economy
 - equilibrium dynamics: simple three-equation representation

- ability to match much of the evidence on the effects of monetary policy and technology shocks

- monetary policy: optimality of inflation targeting

- How does the introduction of open economy elements affect that analysis and prescriptions?
- Can a model with nominal rigidities account for the volatility of nominal and real exchage rates?
- What role should the exchange rate play in the design of policy? What is the optimal degree of exchange rate volatility?

LINTRODUCTION

MODELING CHOICES

NEW CONCEPTS

Open economy aspect brings new concepts: exchange rate, the terms of trade, exports, imports, international financial markets.

Choose from

- Large or small economy
- Ø Nature of international asset markets: autarky or complete markets.
- Oiscrimination between domestic and foreign markets.
- Tradeables vs. nontradeables,
- Trading costs,
- International policy coordination
- Exchange rate regimes

OPEN ECONOMY AND MONETARY POLICY

L HOUSEHOLDS

SMALL OPEN ECONOMY

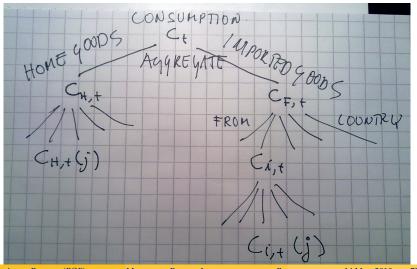

- World economy is a continuum of small open economies represented by the unit interval. → performance of a single economy does not have any impact on the rest of the world.
- Productivity shocks are imperfectly correlated across the economies.
- Identical preference, technology and market structure.
- Notation: no *i*-index refers to domestic (home) economy, *i* ∈ [0, 1] subscript refers to economy *i*, one in the continuum. Superscript * correspond the world economy as a whole.

HOUSEHOLD BUDGET CONSTRAINT REVISITED

Given the market equilibrium (for all of these aggregators), the total consumption expenditure is as follows

$$P_t C_t = P_{H,t} C_{H,t} + P_{F,t} C_{F,t}.$$

The argument is similar to the beginning of the chapter 3. The budget constraint (7.3) can be written in the following form

$$P_t C_t + \mathsf{E}_t \, Q_{t,t+1} D_{t+1} \le D_t + W_t N_t + T_t. \tag{7.5}$$

<ロト < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

OPEN ECONOMY AND MONETARY POLICY

L INDENTITIES

EXCHANGE RATES

 $\mathcal{E}_{i,t}$ is the *bilateral nominal exchange rate*, is price of country *i*'s currency in terms of domestic currency, eg how many euros (domestic country) one US (country *i*) dollar is worth.

 $P_{i,t}^{i}(j)$ is the price of country *i*'s good *j* expressed in terms of its own currency, eg iPhone (*j*) in US (*i*) dollars.

LAW OF ONE PRICE

 $P_{i,t}(j) = \mathcal{E}_{i,t}P_{i,t}^{i}(j)$ for all $i, j \in [0.1]$. Assume it holds at all times for all internationally traded goods. Aggregating results $P_{i,t} = \mathcal{E}_{i,t}P_{i,t}^{i}$, where $P_{i,t}^{i} = \left(\int_{0}^{1}P_{i,t}^{i}(j)^{1-\varepsilon}dj\right)^{\frac{1}{1-\varepsilon}}$

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ▶ ◆ ○ ◆

OPEN ECONOMY AND MONETARY POLICY

L_{INDENTITIES}

EXCHANGE RATES...

- $p_{i,t}^{i} = \int_{0}^{1} p_{i,t}^{i} dj$ is the loglinerized domestic price index for country *i* (in country *i*'s own currency).
 - $e_t = \int_0^1 e_{i,t} di$ is the log of *effective nominal exchange rate*. Note that it is an index.

$$p_t^* = \int_0^1 p_{i,t}^i di$$
 is the log world price index.

Then $P_{F,t}$ may be loglinearized around symmetric steady-state as

$$p_{F,t} = \int_0^1 \left(e_{i,t} + p_{i,t}^i \right) di = e_t + p_t^*,$$

and when combined with the loglinearized terms of trade results

$$s_t = e_t + p_t^* - p_{H,t}.$$
 (7.12)

L_{INDENTITIES}

EXCHANGE RATES.....

Bilateral real exchange rate with country i is defined as

$$\mathcal{Q}_{i,t}\equiv rac{\mathcal{E}_{i,t}P_t^i}{P_t},$$

is the ratio of the two countries' CPIs, both expressed in terms of domestic currency.

 $q_t = \int_0^1 q_{i,t} di$ is the log effective real exchange rate

$$q_t = \int_0^1 (e_{i,t} + p_t^i - p_t) di = e_t + p_t^* - p_t = s_t + p_{H,t} - p_t = (1 - \alpha)s_t$$

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ▶ ◆ ○ ◆

OPEN ECONOMY AND MONETARY POLICY

LIMPORTANT IMPLICATIONS

INTERNATIONAL RISK-SHARING

An analogous optimality condition to (7.6) holds also for the country *i*. When expressed in the domestic currency, it can be written as

$$\mathsf{E}_t \beta \left(\frac{C_{t+1}^i}{C_t^i}\right)^{-\sigma} \left(\frac{\mathcal{E}_t^i P_t^i}{\mathcal{E}_{t+1}^i P_{t+1}^i}\right) = \mathsf{E}_t \, Q_{t,t+1}. \tag{7.13}$$

Combining this with (7.6) (and assuming zero net foreign asset holdings and an *ex ante* identical environment) results

$$C_t = C_t^i \mathcal{Q}_{i,t}^{\frac{1}{\sigma}}.$$
(7.14)

Loglinearizing and aggregating $(c_t^* = \int_0^1 c_t^i di)$ over *i* gives

$$c_t = c_t^* + \frac{1}{\sigma} q_t = c_t^* + \left(\frac{1-\alpha}{\sigma}\right) s_t.$$
 (7.15)

Complete international asset markets equalizes consumption levels between Countries up terms of trade ANTH RIPATH (BOF) MONETARY POLICY, INFLATION AND THE BU 14 Mar 2010 88 / 100

LIMPORTANT IMPLICATIONS

UNCOVERED INTEREST PARITY

Allow households to invest both domestic B_t and foreign B_t^* one-period bonds. The budget constraint may be written as

$$P_t C_t + Q_{t,t+1} B_{t+1} + Q_{t,t+1}^* \mathcal{E}_{i,t} B_{t+1}^* \le B_t + \mathcal{E}_{i,t} B_t^* + W_t N_t + T_t.$$
(7.16)

The optimality conditions wrt to these assets are

$$\beta \mathsf{E}_{t} \left(\frac{C_{t+1}}{C_{t}} \right)^{-\sigma} \left(\frac{P_{t}}{P_{t+1}} \right) = Q_{t,t+1},$$

$$\beta \mathsf{E}_{t} \left(\frac{C_{t+1}}{C_{t}} \right)^{-\sigma} \left(\frac{P_{t}}{P_{t+1}} \right) \left(\frac{\mathcal{E}_{i,t+1}}{\mathcal{E}_{i,t}} \right) = Q_{t,t+1}^{*}.$$

200

<ロト <回ト < 回ト < 三ト - 三・

OPEN ECONOMY AND MONETARY POLICY

-IMPORTANT IMPLICATIONS

Combining these results

$$\Xi_t\left(\frac{\mathcal{E}_{i,t+1}}{\mathcal{E}_{i,t}}\right) = \frac{Q_{t,t+1}^*}{Q_{t,t+1}},$$

whose loglinear form is the familiar

$$i_t = i_t^* + \mathsf{E}_t \Delta e_{t+1}$$

Combining this with the definition of terms of trade, we find that

$$s_t = \mathsf{E}_t \sum_{k=0}^{\infty} \left[(i_{t+k}^* - \pi_{t+k+1}^*) - (i_{t+k} - \pi_{H,t+k+1}) \right].$$

That express the terms of trade as the expected sum of real interest rate differential. Note, however, that this is not an equilibrium condition. It simply combines the two from previous slide with the definition of the terms of trade.

ANTTI RIPATTI (BOF)

14 Mar 2010 90 / 100

OPEN ECONOMY AND MONETARY POLICY

SUPPLY SIDE

FIRMS AND TECHNOLOGIES

The supply side follows the very same structure as in the basic New-Keynesian model. We assume constant-returns-to-scale, $\alpha = 0$ (according to notation of the chapter 3). Firms price is the domestic price $P_{H,t}(j)$ (price index of domestic production). Therefore, the marginal costs area

$$mc_t = -\nu + w_t - p_{H,t} - a_t,$$

where $\nu \equiv -\log(1-\tau)$ (employment subsidy). The Calvo-pricing applies here too:

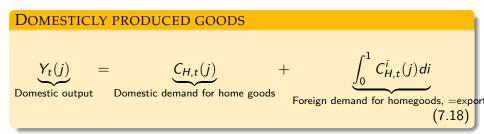

$$\bar{p}_{H,t} = \mu + (1 - \beta\theta) \,\mathsf{E}_t \sum_{k=0}^{\infty} (\beta\theta)^k (mc_{t+k} + p_{H,t+k}), \tag{7.17}$$

where $\bar{p}_{H,t}$ denotes the price of firms allowed to optimize.

OPEN ECONOMY AND MONETARY POLICY

EQUILIBRIUM

GOODS MARKET CLEARING

Notice, that due to nested structure the demand for domestic good j in country i is given by

$$C_{H,t}^{i}(j) = \alpha \left(\frac{P_{H,t}(j)}{P_{H,t}}\right)^{-\varepsilon} \left(\frac{P_{H,t}}{\mathcal{E}_{i,t}P_{F,t}^{i}}\right)^{-\gamma} \left(\frac{P_{F,t}}{P_{t}^{i}}\right)^{-\eta} C_{t}^{i}$$

OPEN ECONOMY AND MONETARY POLICY

L EQUILIBRIUM

In the Cobb-Douglas case, ie $\sigma=\eta=\gamma=1$ this aggregates as

$$Y_t = \mathcal{S}_t^{\alpha} C_t. \tag{7.20}$$

Note that at the world level, the terms of trade is unity, ie $\int_0^1 s_t^i di = 0$. The loglinear approximation of (7.19) around the symmetric steady state is the following

$$y_t = c_t + \alpha \gamma s_t + \alpha \left(\eta - \frac{1}{\sigma}\right) q_t = c_t + \frac{\alpha \omega}{\sigma} s_t, \qquad (7.21)$$

where $\omega \equiv \sigma \gamma + (1 - \alpha)(\sigma \eta - 1)$. Aggregating the country *i* counterparts of (7.21) over all countries results

$$y_t^* \equiv \int_0^1 y_t^i di = \int_0^1 c_t^i di \equiv c_t^*.$$
 (7.22)

OPEN ECONOMY AND MONETARY POLICY

EQUILIBRIUM

Combine (7.21), (7.15) and (7.22) to express output y_t in terms of world demand and terms of trade as

$$y_t = y_t^* + \frac{1}{\sigma_\alpha} s_t, \qquad (7.23)$$

where $\sigma_{\alpha} \equiv \frac{\sigma}{1+\alpha(\omega-1)} > 0$. Finally, combining (7.8) with (7.21) gives

$$y_{t} = \mathsf{E}_{t} y_{t+1} - \frac{1}{\sigma} (i_{t} - \mathsf{E}_{t} \pi_{t+1} - \rho) - \frac{\alpha \omega}{\sigma} \mathsf{E}_{t} \Delta s_{t+1}$$

= $\mathsf{E}_{t} y_{t+1} - \frac{1}{\sigma} (i_{t} - \mathsf{E}_{t} \pi_{H,t+1} - \rho) - \frac{\alpha \Theta}{\sigma} \mathsf{E}_{t} \Delta s_{t+1}$
= $\mathsf{E}_{t} y_{t+1} - \frac{1}{\sigma_{\alpha}} (i_{t} - \mathsf{E}_{t} \pi_{H,t+1} - \rho) + \alpha \Theta \mathsf{E}_{t} \Delta y_{t+1}^{*}$ (7.24)

OPEN ECONOMY AND MONETARY POLICY

L EQUILIBRIUM

COEFFICIENTS IN (7.24)

- Real rate sensitivity: $\sigma_{\alpha} < \sigma$ in the case $\omega > 1$, ie when η and γ are high.
- Foreign output growth sensitivity:

$$\Theta \equiv (\sigma\gamma - 1) + (1 - \alpha)(\sigma\eta - 1) = \omega - 1$$

is positive if η and γ are high (relative to σ).

Intuition: direct negative effect of an increase in the real rate on aggregate demand and output is amplified by the induced ral appreaciation (and the resulting switch toward foreign goods). It is dampened by expected real depreciation (CPI inflation is higher than domestic inflation) which dampens the change in the consumption based real rate $i_t - E_t \pi_{t+1}$ (relative to $i_t - E_t \pi_{H,t+1}$).

COPEN ECONOMY AND MONETARY POLICY

L_{EQUILIBRIUM}

THE TRADE BALANCE

In the pure Cobb-Dougals (eg $\omega = 0$) case (7.19) results

$$P_{H,t}Y_t = P_tC_t, \quad t > 0.$$

which means that the trade balance

$$nx_t \equiv \left(rac{1}{Y}
ight) \left(Y_t - rac{P_t}{P_{H,t}}
ight)$$

is zero all the time. Loglinearize to obtain

$$nx_t = y_t - c_t - \alpha x_t = \alpha \left(\frac{\omega}{\sigma} - 1\right) s_t.$$
(7.25)

Hence, the sign of net exports is ambiguous and depends on (as usual) the elasticities of substitution!

OPEN ECONOMY AND MONETARY POLICY

DETERMINATION OF MARGINAL COSTS

OUTPUT AND EMPLOYMENT

Labour market clearing condition is

$$N_t \equiv \int_0^1 N_t(j) dj = \frac{Y_t}{A_t} \int_0^1 \left(\frac{P_t(j)}{P_t}\right)^{-\varepsilon} dj.$$

Loglinearizing

$$y_t = a_t + n_t \tag{7.26}$$

Calvo-pricing implies

$$\pi_{H,t} = \beta \mathsf{E}_t \, \pi_{H,t+1} + \underbrace{\frac{(1 - \beta \theta)(1 - \theta)}{\theta}}_{=\lambda} \, \hat{mc}_t. \tag{7.27}$$

OPEN ECONOMY AND MONETARY POLICY

DETERMINATION OF MARGINAL COSTS

Marginal cost is given by

$$mc_{t} = -\nu + (w_{t} - p_{H,t}) - a_{t}$$

= $-\nu + (w_{t} - p_{t}) + (p_{t} - p_{H,t}) - a_{t}$
= $-\nu + \sigma c_{t} + \varphi n_{t} + \alpha s_{t} - a_{t}$
= $-\nu + \sigma y_{t}^{*} + \varphi y_{t} + s - (1 + \varphi)a_{t}$ (7.28)
= $-\nu + (\sigma_{\alpha} + \varphi)y_{t} + (\sigma - \sigma_{\alpha})y_{t}^{*} - (1 + \varphi)a_{t}$ (7.29)

Channels

- φ : output via employment
- σ_{α} : output via terms of trade
- σ : world output via consumption (real wage)
- σ_{α} : world output via terms of trade

LIMPULSE RESPONSES

An Extension with Imperfect Pass-Through (Monacelli JIE 05)

Setup as in GM, with rest of the world modelled as a single economy.

Key Assumption:

- imports sold through retail firms
- price at the dock: $e_t + p_{Ft}^*(j)$
- staggered price setting by retailers \implies in general, $p_{F,t}(j) \neq e_t + p_{F,t}^*(j)$

Law of One Price Gap:

$$\psi_{F,t} \equiv e_t + p_t^* - p_{F,t}$$

Consistent with the evidence (Campa and Goldberg (REStat 05):

- partial pass-through in the short run
- full pass through in the long run (for most industries).
